Installation, inspection, commissioning and troubleshooting of the device
141 must only be carried out by a competent electrician.

This manual is amended periodically and will be brought into line with new software releases. The change status (software version and date) can be found in the contents footer. If you have a device with a later software version, please check
www.elsner-elektronik.de in the menu area "Service" to find out whether a more up-todate version of the manual is available.

## Clarification of signs used in this manual

Safety advice.

DANGER!

WARNING!

CAUTION!

Safety advice for working on electrical connections, components, etc.
... indicates an immediately hazardous situation which will lead to death or severe injuries if it is not avoided.
... indicates a potentially hazardous situation which may lead to death or severe injuries if it is not avoided.
... indicates a potentially hazardous situation which may lead to trivial or minor injuries if it is not avoided.

ATTENTION! ... indicates a situation which may lead to damage to property if it is not avoided.

ETS
In the ETS tables, the parameter default settings are marked by underlining.

## 1. Description

The Sensor Sewi KNX L-Pr for the KNX building bus system captures brightness and motion in rooms. The brightness value measured can be used for the control of limitdependent switching outputs. States can be linked via AND logic gates and OR logic gates. Multi-function modules change input data as required by means of calculations, querying a condition, or converting the data point type.

## Functions:

- Brightness measurement with brightness control
- Motion detection
- Threshold values can be adjusted per parameter or via communication objects
- 8 AND and 8 OR logic gates, each with 4 inputs. All switching events as well as 16 logic inputs in the form of communications objects can be used as inputs for the logic gates. The output of each gate can be configured optionally as 1bit or $2 \times 8$-bit
- 8 multi-function modules (computers) for changing the input data by calculations, by querying a condition or by converting the data point type

Configuration is made using the KNX software ETS. The product file can be downloaded from the Elsner Elektronik website on www.elsner-elektronik.de in the "Service" menu.

### 1.0.1. Scope of delivery

- Combined sensor

### 1.1. Technical data

| Housing | Plastic |
| :--- | :--- |
| Colours | $\bullet$ <br>  <br> (skirting)/ grey white RAL 9002 (cover) <br> • Jet black RAL 9005 |
| Assembly | Surface, ceiling installation |
| Protection category | IP 30 |
| Dimensions | $\emptyset$ approx. 105 mm, height approx. 32 mm |
| Total weight | approx. 50 g |
| Ambient temperature | Operation $-20 \ldots+60^{\circ} \mathrm{C}$, storage $-20 \ldots+70^{\circ} \mathrm{C}$ |
| Ambient humidity | max. $95 \%$ RH, avoid condensation |
| Operating voltage | KNX bus voltage |
| Bus current | max. 10 mA |
| Data output | KNX $+/-$ bus plug-in terminal |
| BCU type | Integrated microcontroller |
| PEl type | 0 |
| Group addresses | max. 2000 |

| Assignments | max. 2000 |
| :--- | :--- |
| Communication objects | 230 |
| Brightness sensor: |  |
| Measurement range | 0 lux $\ldots 2,000$ lux (higher values can be measured and out- <br> put) |
| Resolution | 1 lux at $0 \ldots 2,000$ lux |
| Accuracy | $\pm 15 \%$ of the measurement value at 30 lux $\ldots 2,000$ lux |
| Motion sensor: | approx. $94^{\circ} \times 82^{\circ}$ (see also Coverage area of the motion <br> detector) |
| Coverage angle | approx. 5 m |
| Range |  |

The product conforms with the provisions of EU directives.

## 2. Installation and start-up

### 2.1. Installation notes

Installation, testing, operational start-up and troubleshooting should only be performed by an electrician.

## CAUTION!

## Live voltage!

There are unprotected live components inside the device.

- National legal regulations are to be followed.
- Ensure that all lines to be assembled are free of voltage and take precautions against accidental switching on.
- Do not use the device if it is damaged.
- Take the device or system out of service and secure it against unintentional use, if it can be assumed, that risk-free operation is no longer guaranteed.

The device is only to be used for its intended purpose. Any improper modification or failure to follow the operating instructions voids any and all warranty and guarantee claims.

After unpacking the device, check it immediately for possible mechanical damage. If it has been damaged in transport, inform the supplier immediately.

The device may only be used as a fixed-site installation; that means only when assembled and after conclusion of all installation and operational start-up tasks and only in the surroundings designated for it.

Elsner Elektronik is not liable for any changes in norms and standards which may occur after publication of these operating instructions.

### 2.2. Installation location

Install and use only in dry interior rooms! Avoid condensation.

The Sensor Sewi KNX L-Pr is installed surface mounted on ceilings.
For capturing movement make sure that the desired area is covered by the sensor's coverage angle and that no obstacles obstruct the recording.

### 2.2.1. Coverage area of the motion detector

Angle of coverage: approx. $94^{\circ} \times 82^{\circ}$
Range: approx. 5 m

## Segmentation of the coverage area

Fig. 1

Size of the coverage area

| Distance | Length | Width |
| :--- | :--- | :--- |
| 2.50 m | approx. 5.40 m | approx. 4.30 m |
| 3.50 m | approx. 7.50 m | approx. 6.10 m |

### 2.3. Construction of the sensor

### 2.3.1. Housing from the outside

Fig. 2
1 Brightness sensor
2 Motion sensor
A Recess to open the housing. When closing the housing, the recess aligns to the marking on the skirting

### 2.3.2. Printed circuit boards / connections

5 Programming LED
6 KNX-terminal BUS +/-
7 Cable bushing
A Mark for aligning the cover

### 2.4. Assembly

Fig. 4
Open the housing. To do this, carefully lift the cover from the skirting. Start at the recess (Fig. 2: A).

Fig. 5
Lead the bus cable through the cable bushing in the skirting.

Fig. 6
Screw the skirting to the ceiling.
Hole distance 60 mm .

Fig. 7
Connect the KNX bus to the KNX terminal.

Fig. 8
Close the housing by positioning the cover and snapping it into place. To do this, align the recess on the cover to the marking on the skirting (Fig. 2+3: A).

### 2.5. Notes on mounting and commissioning

Never expose the device to water (e.g. rain) or dust. This can damage the electronics. You must not exceed a relative humidity of $95 \%$. Avoid condensation.

The air slots on the side must not be closed or covered. The brightness sensor and the motion sensor must not be painted over or covered.
After the bus voltage has been applied, the device will enter an initialisation phase lasting a few seconds. During this phase no information can be received or sent via the bus.

The motion sensor has a start-up phase of approx. 15 seconds during which no motion detection takes place.

## 3. Addressing the equipment

The equipment is delivered with the bus address 15.15.255. You can program a different address in the ETS by overwriting the address 15.15 .255 or by teaching the device via the programming button.

The programming button is on the inside of the housing (Fig. 3: No. 4).

## 4. Maintenance

The brightness sensor, the motion sensor and the air slots on the side must not get dirty or covered. As a rule, it is sufficient to wipe the device with a soft, dry cloth twice a year.

## 5. Transfer protocol

## Units:

Brightness in Lux

### 5.1. List of all communication objects

## Abbreviation flags:

C Communication
$R$ Read
W Write
$T$ Transfer
$\cup$ Update

## 6. Parameter setting

### 6.1. Behaviour on power failure/ restoration of power

## Behaviour following a failure of the bus power supply:

The device sends nothing.

## Behaviour on bus restoration of power and following programming or reset:

The device sends all outputs according to their send behaviour set in the parameters with the delays established in the "General settings" parameter block.

### 6.2. General settings

Set basic characteristics for the data transfer.

| Send delay after power-up and programming for: |  |
| :--- | :--- |
| Measured values | $\underline{5 \mathrm{~s} \bullet} \cdot \boldsymbol{\bullet} 2 \mathrm{~h}$ |
| Threshold values and switching outputs | $\underline{5 \mathrm{~s}} \bullet \ldots \bullet 2 \mathrm{~h}$ |
| Computer objects | $\underline{5 \mathrm{~s} \bullet \ldots \cdot 2 \mathrm{~h}}$ |
| Logic objects | $\underline{5 \mathrm{~s}} \bullet \ldots \bullet 2 \mathrm{~h}$ |
| Maximum telegram rate | $\bullet 1$ message per second |
|  | $\bullet \ldots$ |
|  | $\bullet \bullet \ldots$ messages per second |
|  | $\bullet .20$ messages per second |

### 6.3. Motion detector

The motion detector detects movement by means of temperature differences. Please note that the "no movement" message is only sent to the bus after a 5 second delay. After connecting the operating voltage and after a reset, it takes 15 seconds until the sensor is ready for operation.

Activate the test object if you would like to test the motion detection while commissioning.

With an active test object, you can enter the settings for analysis of the release object, the value prior to the first communication, and the type and value of the test object.

| Use test object | No - Yes |
| :---: | :---: |
| If test object is used: |  |
| Release object analysis | - at value 1: release \| at value 0: block <br> - at value 0: release \| at value 1: block |
| Value prior to first communication | $0 \cdot 1$ |
| Type of test object | - 1 bit <br> - 1 byte (0...255) <br> - 1 byte (0\%...100\%) <br> - 1 byte ( $0^{\circ} . . .360^{\circ}$ ) <br> - 1 byte $0 . . .63$ ) scenario call-up <br> - 2 byte counter without math. symbol <br> - 2 byte counter with math. symbol <br> - 2 byte floating point <br> - 4 byte counter without math. symbol <br> - 4 byte counter with math. symbol <br> -4 byte floating point |
| Test object value for movement | e.g. $0 \bullet 1$ [depending on the type of test object] |
| Test object value without movement | e.g. $\underline{0} \bullet 1$ [depending on the type of test object] |

Select whether the motion detector is operated as master or slave.
For a master device, the reactions to motion detection are filed in the master settings 1 to 4. The master can thus control up to four different lamps, scenarios etc. and, as an option, also observe incoming motion messages from slave devices.
A slave device sends a motion message to the master via the bus.

| Mode | $\underline{\text { Slave }} \bullet$ Master |
| :--- | :--- |

## Motion detector as slave:

Activate the slave in order to use it.

| Use slave | $\underline{N o} \bullet$ Yes |
| :--- | :--- |

When a motion is detected, the device periodically sends a 1 to the master via the bus.

> Information on setting the slave sending cycle and the cycle reset can be found in chapter Align communication between master and slave, page 24 .

Set the sending cycle shorter than the master's switch-off delay.
Sending cycle in the event of movement
1...240; $\underline{2}$ (in seconds)

Set the object type and value for the cycle reset input for the slave in the same way as for the cycle reset output for the master.

| Cycle reset object type | $\bullet 1$ bit |
| :--- | :--- |
|  | $\bullet 1$ byte $(0 \% \ldots 100 \%)$ |
| Cycle reset at value | $0 \bullet 1$ and/or $0 \ldots 100 ; 1$ |

The slave can be blocked via the bus.

| Use block | $\underline{\text { No }} \bullet$ Yes |
| :--- | :--- |
| Analysis of the blocking object | $\bullet$ at value 1: block \| at value 0: release <br> at value 0: block \| at value 1: release |
| Value prior to first communication | $\underline{0} \bullet 1$ |

### 6.3.1. Master $1 / 2 / 3 / 4$

If the device is set as a master, the additional master settings 1 to 4 will appear. This enables the Sensor Sewi KNX L-Pr to perform four different control functions for motion detection. Activate the master in order to use it.

| Use master $1 / 2 / 3 / 4$ | $\underline{\text { No }} \bullet$ Yes |
| :--- | :--- |

Set, in which cases threshold values and delay times received via object are to be retained. The parameter is only taken into consideration if the setting via object is activated below. Please note that the setting "After power supply restoration and pro-
gramming" should not be used for the initial start-up, as the factory settings are always used until the 1st communication (setting via objects is ignored).

| Maintain the |  |
| :--- | :--- |
| threshold values and delays received <br> via communication objects | • never <br> • <br> efter power supply restoration <br> efter power supply restoration and <br> programming |
|  |  |

Select, whether motion is to be detected constantly or brightness dependent.

| Motion detection | $\underline{\text { constantly } \bullet}$ brightness dependent |
| :--- | :--- |

## Settings for brightness dependent motion detection:

The brightness dependent motion detection can be used via separate threshold values for switch-on and switch-off or dependent on daylight. The separate threshold values are ideal for controlling the light in rooms which are only illuminated by artificial light. The daylight dependent control is ideal for rooms with daylight and artificial light.

| Motion detection | brightness dependent |
| :--- | :--- |
| Type of brightness dependency | $\bullet$ separate switch-on and switch-off values |
|  | $\bullet$ daylight dependent |

For daylight dependent motion detection with separate switch-on and switch-off threshold values activate, as required, the objects for setting the threshold values. Then specify the switch-on and switch-off values (brightness range). The switch-on value is the value, below which the room should be lit in the event of movement. The switch-off value should be higher than the brightness value of the artificially lit room.

| Type of brightness dependency | • separate switch-on and switch-off <br> values |
| :--- | :--- |
| Threshold values can be set via objects | $\underline{\text { No } \bullet \text { Yes }}$ |
| Switch on sensor below <br> Lux | $1 \ldots 5000 ; \underline{200}$ |
| Switch off sensor below <br> Lux | $1 . .5000 ; \underline{500}$ |

For the daylight dependent motion detection activate, as required, the objects for setting the threshold values/hysteresis and waiting period. Then specify the switch-on value. This is the value, below which the room should be lit in the event of movement.

The switch-off value is derived from the brightness measurement that is performed by the sensor at the end of the waiting period. Set the waiting period such that after it all lamps are set to the final brightness. The hysteresis is added to the measured bright-
ness value. If the room brightness later exceeds this total value because the room is illuminated by daylight, the motion control is switched off.

| Type of brightness dependency | $\bullet$ Daylight dependent |
| :--- | :--- |
| Threshold values and hysteresis can be set <br> via objects | $\underline{\text { No }}$ • Yes |
| Waiting period can be set via objects | $\underline{\text { No } \bullet \text { Yes }}$ |
| Switch on sensor below <br> Lux | $1 \ldots 5000 ; \underline{200}$ |
| Switch off sensor, at the earliest <br> after a waiting period of seconds | $0 . . .600 ; \underline{5}$ |
| after motion detection and above <br> measured brightness plus hysteresis <br> in Lux | $1 \ldots 5000 ; \underline{200}$ |

## Settings for all types of motion detection:

The following settings can be made, independent of the motion detection type, i.e. for "constant" and "brightness dependent" motion recognition.
Define the output type and value. As a result of the different types, switchable lights ( 1 bit), dimmer ( 1 Byte $0-100 \%$ ), scenarios ( 1 Byte $0 . . .63$ scenario call-up) and other functions can be controlled.

| Output type | $\bullet 1$ bit |
| :--- | :--- |
|  | $\bullet 1$ byte $(0 \ldots 255)$ |
|  | $\bullet 1$ byte $(0 \% \ldots 100 \%)$ |
|  | $\bullet 1$ byte $\left(0^{\circ} \ldots 360^{\circ}\right)$ |
|  | $\bullet 2$ byte $(0 \ldots 63)$ scenario call-up |
|  | $\bullet 2$ byte counter without math. symbol with math. symbol |
|  | $\bullet 2$ byte floating point |
|  | $\bullet 4$ byte counter without math. symbol |
|  | $\bullet 4$ byte counter with math. symbol |
|  | $\bullet 4$ byte floating point |
| Output value in the event of motion | e.g. $0 \bullet 1$ [depending on the output type] |
| Output value without motion | e.g. $\underline{0} \bullet 1$ [depending on the output type] |
| Output value when blocked | e.g. $\underline{0} \bullet 1$ [depending on the output type] |

Select whether delays can be set via objects and specify the switching delays. By setting a blocking time after switch-off, you prevent sensors from recognising a swit-ched-off lamp in their detection zone as a temperature change, and sending a motion message.

| Delays can be set via objects <br> (in seconds) | $\underline{N o} \bullet$ Yes |
| :--- | :--- |
| Switch on delay <br> (for setting via objects: valid until | $\frac{0 \mathrm{~s}}{(\text { (for daylight dependent motion detection: }}$ <br> fixed value 0 s ) |

| Switch off delay <br> (for setting via objects: valid until <br> 1st communication) | $0 \mathrm{~s} \bullet 5 \mathrm{~s} \bullet \underline{10 \mathrm{~s} \bullet \ldots 2 \mathrm{~h}}$ |
| :--- | :--- |
| Blocking time for motion detection <br> after switch off delay in seconds | $0 \ldots 600 ; \underline{2}$ |

Set the master's output sending pattern.

| Sending pattern | $\bullet$ on change <br> $\bullet$ <br> on change to movement <br> $\bullet$ on change to no movement <br> $\bullet$ on change and periodically <br> $\bullet$ on change to movement and periodically <br> $\bullet$ on change to no movement periodically |
| :--- | :--- |
| Cycle <br> (if sent periodically) | $1 \mathrm{~s} \bullet \underline{5 \mathrm{~s} \bullet \ldots 2 \mathrm{~h}}$ |

In addition, you can refer to a slave signal, i.e. a signal from an additional motion detector, for controlling purposes.

| Use slave signal | $\underline{\text { No }} \bullet$ Yes |
| :--- | :--- |

The slave device periodically sends a 1 to the bus, as long as a motion is detected. The master receives this at the input object "master: slave message" and evaluates the slave message as an own sensor message.

Furthermore, the master has the possibility of triggering a reset of the slave sending cycle.

## Information on setting the slave sending cycle and the cycle reset can be found in chapter Align communication between master and slave, page 24.

Set the object type and value for the master's slave cycle reset output in the same way, as the cycle reset input for the slave.

| Slave cycle reset object type | $\bullet 1$ bit <br> $\bullet 1$ byte $(0 \% \ldots 100 \%)$ |
| :--- | :--- |
| Cycle reset at value | $0 \bullet \underline{1}$ and/or $0 \ldots 100 ; \underline{1}$ |

The master can be blocked via the bus.

| Use block | $\underline{\text { No } \bullet \text { Yes }}$ |
| :--- | :--- |
| Analysis of the blocking object | $\bullet$ at value 1: block $\mid$ at value 0: release <br> $\bullet$ <br> at value 0 : block \| at value 1: release |
| Value prior to first communication | $\underline{0} \bullet 1$ |
| Output pattern |  |

| On block | $\bullet \frac{\text { do not send anything }}{}$ |
| :--- | :--- |
| Send value |  |
|  | $\bullet$ as for transmission pattern |
|  | $\bullet \frac{\text { send current value immediately }}{}$ |

### 6.3.2. Align communication between master and slave

## Sending cycle slave - switch-off delay master

Set the slave's sending cycle shorter than the master's switch-off delay. Thereby it is ensured that the master does not perform a switch-off action, while the slave is still detecting a motion.

## Slave cycle reset

The cycle reset for the slave is required, if a master switch action by the "master: central off" object was triggered.

When the master performs a switch-off action, it simultaneously sends a message to the bus via the "master: slave cycle reset". . This message can be received by the slave via the "slave: cycle reset" in order to immediately send a message to the bus in the event of a motion detection. The master receives the motion message without having to wait for the next slave transmission cycle.

Please note that object type and value for the slave's cycle reset input and the master's cycle reset output must be set the same.

## Application Example:

A person steps into a corridor, the master recognises this movement and switches on the corridor lighting. When leaving the corridor, the person wants to switch off the light using a switch.

However, in the meantime a second person has entered the corridor who is detected by a slave. This person would be in darkness and would have to wait for the slave's next transmission cycle before the light would be switched on again.

To prevent this, the switch command is connected to the "master: central off" object. As a result, the master sends a cycle reset command to the slave if the light is switched off manually. In the present example, the master would immediately switch the light back on.

### 6.4. Light control

For light control, the sensor detects the brightness in the room. Activate the light control.

| Use control | $\underline{\text { No }} \bullet$ Yes |
| :--- | :--- |

Set, in which cases the data received via object for setpoint value, setpoint value-actual difference, dimming increment and times are to be retained. Please note that the
setting "After power supply restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first communication.

| Maintain the |  |
| :--- | :--- |
| data received via object for setpoint, set- <br> point-actual difference, dimming increment <br> and times | $\bullet$ 年ever <br> • after power supply restoration <br> $\bullet$ after power supply restoration and <br> programming |
|  |  |

Set the setpoint value for the brightness in the room and specify whether, besides the dimming information defined below, a switching object should also be sent.

| Setpoint value in Lux | $0 . . .60000 ; \underline{500}$ |
| :--- | :--- |
| Send switching object | $\underline{\text { No }} \bullet$ Yes |

Specify, whether the light control is activated by movement and/or by a start/ stop object. For a regulation by movement, the device's internal motion detector is analysed.

Set the object evaluation and the object value prior to the first communication. Define, for how many seconds the regulation is to continue to run after the end of the movement.
At the end of the regulation, either "nothing" (status remains unchanged), an on or off command (via the activated switching object) or a dim value can be sent.

| Regulation starts on | - movement <br> - reception of a start/stop-object <br> - reception of a start/stop-object or movement |
| :---: | :---: |
| Regulation stops on | - movement <br> - reception of a start/stop-object <br> - reception of a start/stop-object or movement |
| Object evaluation | - $1=$ start $\mid 0=$ stop <br> - 0 = start \| $1=$ stop |
| Object value prior to initial communication | $0 \cdot 1$ |
| Stop delay in seconds after the movement has ended | 0...1800; 120 |
| Reaction to stop | - send nothing <br> - send off command <br> - send on command <br> - send value |
| Value in \% | 0... 100 |

Set, at which deviation from the setpoint value a dim command is to be sent. Specify the dimming increment and the repetition cycle for the dim command.
Define, up to which response value the dim actuator sends a brighter or darker command. On the one hand, this defines the range of use for the lamp, on the other hand,
once the minimum or maximum value has been reached, no unnecessary messages are sent to the bus.

| Send the dim command, if | $\bullet$ the actual value deviates from the setpo- <br> int value by more than $\mathrm{X} \%$ |
| :--- | :--- |
|  | $\bullet$ the actual value deviates from the setpoint <br> value by more than X Lux |
| Target / actual difference in \% <br> (for a deviation in \%) | $1 \ldots 100 ; \underline{20}$ |
| Target / actual difference in Lux <br> (for a deviation in Lux) | $100.00 \% \bullet 50.00 \% \bullet 25.00 \% \bullet 12.5 \% \bullet 6.25 \% \bullet$ <br> Dimmer increments |
| Repetition of the dim command in seconds | $1 \ldots 600 ; \underline{6}$ |
| Dim brighter with response value in \% | $1 \ldots .56 \%$ |
| Dim darker with response value in \% | $\underline{0 . . .99}$ |

The light regulation can be interrupted during switching or dimming by response objects, i.e. nothing else is transmitted via the dim-output. This results in the manual light operation having priority.

Set, which objects will trigger interruption and when the regulation is to be continued.

| Use interruptions | No - Yes |
| :---: | :---: |
| Interrupt regulation when |  |
| Reception from response switching object | No - Yes |
| Reception from response dimming object | No - Yes |
| Continue regulation | - after a waiting period <br> - at movement after waiting period <br> - at object reception after waiting period <br> - at object reception or after waiting period <br> - at movement after object reception <br> - at object reception or movement after waiting period |
| Waiting period in seconds | 5... 72000 (Standard value depending on the setting of "continue regulation") |
| Object value | $0 \cdot 1 \cdot 0$ or 1 |

Note: If the criteria for the continuation of the regulation are fulfilled, the regulation, however, has just been stopped by an object or is blocked, then the end of the interruption has no effect on the behaviour of the light.

The light regulation can be blocked via the bus. In contrast to the interruption, when blocking, a switching command or brightness value can be sent. Upon release, the output behaviour follows the rule.

| Use block | No - Yes |
| :---: | :---: |
| Analysis of the blocking object | - at value 1: block \| at value 0: release <br> - at value 0: block \| at value 1: release |
| Value prior to initial communication | $\underline{0} \cdot 1$ |
| Output pattern |  |
| On block | - send nothing <br> - send off command <br> - send on command <br> - send value |

### 6.5. Brightness Measurement

The Sensor Sewi KNX L-Pr detects the brightness in rooms, for example for controlling lights.

Set the sending pattern for the measured brightness.

| Sending pattern | $\bullet \frac{\text { never }}{\bullet}$periodically <br> on change <br> $\bullet$ on change and periodically <br> at and above change in $\%$ <br> (if sent on change) <br> Send cycle <br> (if sent periodically)$\quad \underline{5 \mathrm{~s} \ldots 2 \mathrm{~h}}$ |
| :--- | :--- |

The brightness reading can be corrected in order to compensate for a dull or bright point of installation for the sensor.
Use reading correction $\quad \underline{\text { No }} \bullet$ Yes

Set, in which cases the correction factor received via object is to be retained. Please note that the setting "After power supply restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first communication (setting via objects is ignored).
Specify the starting correction factor.

| Maintain the |  |
| :--- | :--- |
| correction factor received via <br> communication object | • $\frac{\text { never }}{\text {-fter power supply restoration }}$ <br> $\bullet$ after power supply restoration and <br> programming |
| Start correction factor in 0.001 <br> valid till first communication | $1 \ldots 10000 ; 1000$ |

Examples:
For a factor of 1.234 the parameter value is 1234 .
For a factor of 0.789 the parameter value is 789 .
For a factor of 1.2 and a reading of 1000 Lux the transmitted value is 1200 Lux.

### 6.6. Brightness threshold values

Activate the required brightness threshold value. The menus for setting the threshold values are displayed.

| Threshold value $1 / 2 / 3 / 4$ | $\underline{\text { No }} \bullet$ Yes |
| :--- | :--- |

### 6.6.1. Threshold value $1 / 2 / 3 / 4$

## Threshold value

Set, in which cases threshold values and delay times received are to be kept per object. The parameter is only taken into consideration if the specification/ setting by object is activated further down. Please note that the setting "After power restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first call (setting via objects is ignored).

| Maintain the |  |
| :--- | :--- |
| threshold values and delays received via <br> communication objects | • never_- <br> • after power supply restoration <br> • after power supply restoration and <br> programming |
|  |  |

Select whether the threshold value is to be specified per parameter or via a communication object.

| Threshold value setpoint using | $\underline{\text { Parameter }} \bullet$ Communications object |
| :--- | :--- |

When the threshold value per parameter is specified, then the value is set.

| Threshold value in kLux | $1 \ldots 5000 ; \underline{200}$ |
| :--- | :--- |

When the threshold value per communication object is specified, the starting value, object value limit and type of change to the threshold value are then set.

| Start threshold value in Lux <br> valid until first call | $1 \ldots 5000 ; \underline{200}$ |
| :--- | :--- |
| Object value limit (min.) in Lux | $\underline{1} \ldots 5000$ |
| Object value limit (max.) in Lux | $1 \ldots 5000$ |
| Type of threshold change | $\underline{1 \cdot 2 \cdot 5 \cdot 10 \cdot 20 \bullet 50 \bullet 100} \bullet 200 \bullet 500 \bullet 1000$ |
| Increment in Lux <br> (upon increase/decrease change) |  |

With both of the methods for specifying the threshold values the hysteresis is set.

| Hysteresis setting | in \% • absolute |
| :--- | :--- |
| Hysteresis in \% of the threshold value <br> (for setting in \%) | $0 \ldots 100 ; \underline{50}$ |
| Hysteresis in Lux <br> (for absolute setting) | $0 \ldots 5000 ; \underline{200}$ |

## Switching output

Define which value the output transmits if the threshold value is exceeded or undercut. Set the delay for the switching and in which cases the switch output transmits.

| When the following conditions apply, the output is (LV = Threshold value) | - GW above $=1 \mid$ GW - Hyst. below $=0$ <br> - GW above $=0 \mid$ GW - Hyst. below $=1$ <br> - GW below $=1 \mid$ GW + Hyst. above $=0$ <br> $\bullet$ GW below $=0 \mid$ GW + Hyst. above $=1$ |
| :---: | :---: |
| Delays can be set via objects (in seconds) | No ${ }^{*}$ Yes |
| Delay from 0 to 1 | none - $1 \mathrm{~s} . . .2 \mathrm{~h}$ |
| Delay from 1 to 0 | none •1 s .. 2 h |
| Switching output sends | on change <br> - on change to 1 <br> - on change to 0 <br> - on change and periodically <br> - on change to 1 and periodically <br> - on change to 0 and periodically |
| Cycle (if sent periodically) | 5 s ... 2 h |

## Block

If necessary, activate the switching output block and set what a 1 or 0 at the block entry means and what happens in the event of a block.

| Use switching output block | $\underline{\text { No } \bullet \text { Yes }}$ |
| :--- | :--- |
| Analysis of the blocking object | $\bullet$ At value 1: block <br> At value 0: block \| At value 0: release |
| Blocking object value before first call | $\underline{0} \bullet 1$ |
| Action when locking | $\bullet$ Do not send message <br> $\bullet$ send 0 <br> $\bullet$ send 1 |
| Action upon release <br> (with 2 seconds release delay) | [Dependent on the "Switching output <br> sends" setting] |

The behaviour of the switching output on release is dependent on the value of the parameter "Switching output sends" (see "Switching output")

| Switching output sends on change | do not send message $\bullet$ <br> Status object/s send/s |
| :--- | :--- |

| Switching output sends on change to 1 | do not send message $\bullet$ <br> If switching output $=1 \rightarrow$ send 1 |
| :--- | :--- |
| Switching output sends on change to 0 | do not send message $\bullet$ |
|  | If switching output $=0 \rightarrow$ send 0 |
| Switching output sends on change and <br> periodically | Send switching output status |
| Switching output sends on change to 1 and <br> periodically | If switching output $=1 \rightarrow$ send 1 |
| Switching output sends on change to 0 and <br> periodically | If switching output $=0 \rightarrow$ send 0 |

### 6.7. Night

If necessary, activate the night recognition.
Use night recognition $\quad \underline{\text { No }}$ •Yes

Set, in which cases delay times received are to be kept per object. The parameter is only taken into consideration if the setting by object is activated further down. Please note that the setting "After power restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first call (setting via objects is ignored).
Maintain the
delays received via communication objects

- never
- after power supply restoration
- after power supply restoration and programming

Specify below which brightness the device should recognise "night" and with which hysteresis this is to be outputted.

| Night is recognised below Lux | $1 \ldots 1000 ; \underline{10}$ |
| :--- | :--- |
| Hysteresis in Lux | $0 \ldots 500 ; \underline{5}$ |

Set the delay for the switching and in which cases the switch output sends and which value is output at night.

| Delays can be set via objects <br> (in seconds) | $\underline{\text { No }} \bullet$ Yes |
| :--- | :--- |
| Switching delay on night | $\underline{\text { none }} \bullet 1 \mathrm{~s} \ldots 2 \mathrm{~h}$ |
| Switching delay on day | $\underline{\text { none }} \bullet 1 \mathrm{~s} \ldots 2 \mathrm{~h}$ |

| Switching output sends | $\bullet$ on change <br> $\bullet$ <br> $\bullet$ on change to night <br> $\bullet$ on change to day <br> $\bullet$ on change and periodically <br> $\bullet$ on change to night and periodically |
| :--- | :--- |
| Send cycle <br> (if sent periodically) | $\underline{5 \mathrm{~s} . . .2 \mathrm{~h}}$ |
| Object value at night | $\mathbf{0 \bullet} \underline{1}$ |

### 6.8. Computer

Activate the multi-functional computer, with which the input data can be changed by calculation, querying a condition or converting the data point type. The menus for the further setting of the computer are then displayed.
Computer $1 / 2 / 3 / 4 / 5 / 6 / 7 / 8 \quad$ No • Yes

### 6.8.1. Computer 1-8

Set, in which cases input values received are to be kept per object. Please note that the setting "After power restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first call (setting via objects is ignored).

| Maintain the |  |
| :--- | :--- |
| input values received via communication <br> objects | • never <br> $\bullet$ after power supply restoration <br> $\bullet$ after power supply restoration and <br> programming |
|  |  |

Select the function set the input mode and starting values for input 1 and input 2.

| Function ( $1=$ Input) | - Prerequisite: E1 = E2 <br> - Prerequisite: E1 > E2 <br> - Prerequisite: E1 >= E2 <br> - Prerequisite: E1 < E2 <br> - Prerequisite: E1 <= E2 <br> - Prerequisite: E1-E2 >= E3 <br> - Prerequisite: E2-E1 >= E3 <br> - Prerequisite: E1-E2 amount >= E3 <br> - Calculation: E1 + E2 <br> - Calculation: E1-E2 <br> - Calculation: E2-E1 <br> - Calculation: E1-E2 Amount <br> - Calculation: Output $1=\mathrm{E} 1 \times \mathrm{X}+\mathrm{Y} \mid$ Output $2=\mathrm{E} 2 \times \mathrm{X}+\mathrm{Y} \mid$ <br> - Transformation: General |
| :---: | :---: |
| Tolerance for comparison (in the case of prerequisite E1 = E2) | O ... 4,294,967,295 |
| Input type | [Selection options depending on the function] <br> - 1 bit <br> - 1 byte (0...255) <br> - 1 byte ( $0 \% . . .100 \%$ ) <br> - 1 byte ( $0^{\circ} . . .360^{\circ}$ ) <br> - 2 byte counter without math. symbol <br> - 2 byte counter with math. symbol <br> - 2 byte floating point <br> - 4 byte counter without math. symbol <br> - 4 byte counter with math. symbol <br> - 4 byte floating point |
| Starting value E1 / E2 / E3 | [Input range depending on the type of input] |

## Prerequisites

When querying the prerequisites set the output type and output values at different statuses:

| Output type | $\bullet 1$ bit |
| :--- | :--- |
|  | $\bullet 1$ byte $(0 \ldots 255)$ |
|  | $\bullet 1$ byte $(0 \% \ldots 100 \%)$ |
|  | $\bullet 1$ byte $\left(0^{\circ} \ldots 360^{\circ}\right)$ |
|  | $\bullet 2$ byte counter without math. symbol |
|  | $\bullet 2$ byte counter with math. symbol |
|  | $\bullet 2$ byte floating point |
|  | $\bullet 4$ byte counter without math. symbol |
|  | $\bullet 4$ byte counter with math. symbol |
|  | $\bullet 4$ byte floating point |
| Output value (if applicable output value $\mathbf{A 1}$ / $\boldsymbol{A} 2$ ) |  |

| if the condition is met | O [Input range depending on the type of <br> output] |
| :--- | :--- |
| if the condition is not met | O [Input range depending on the type of <br> output] |
| if the monitoring time period <br> is exceeded | O [Input range depending on the type of <br> output] |
| if blocked | O [Input range depending on the type of <br> output] |

Set the output send pattern.

| Output sends | $\bullet$ on change <br> $\bullet$ <br> on change and after reset <br> on change and periodically <br> $\bullet$ when receiving an input object <br> $\bullet$ when receiving an input object <br> and periodically |
| :--- | :--- |
| Type of change <br> (is only sent if "on change" is selected) | $\bullet$ on each change <br> $\bullet$ <br> on change to condition met <br> on change to condition not met |
| Send cycle <br> (if sent periodically) | $5 \mathrm{~s} \ldots 2 \mathrm{~h} ; \underline{10 \mathrm{~s}}$ |

Set the text to be displayed for conditions met / not met.

| Text if the condition is met | [Free text max. 14 chars.] |
| :--- | :--- |
| Text if the condition is not met | [Free text max. 14 chars.] |

If applicable set the send delays.

| Send delay in the event of change <br> to the condition is met | $\underline{\text { none } \bullet 1 \mathrm{~s} \bullet \ldots \bullet 2 \mathrm{~h}}$ |
| :--- | :--- |
| Send delay in the event of change <br> to the condition is not met | $\underline{\text { none } \bullet 1 \mathrm{~s} \bullet \ldots \bullet 2 \mathrm{~h}}$ |

## Calculations and transformation

For calculations and transformations set the output values to the various conditions:

| Output value (if applicable A1 / A2) |  |
| :--- | :--- |
| if the monitoring time period <br> is exceeded | [Input range depending on the type of <br> output] |
| if blocked | $\underline{0}$ [Input range depending on the type of <br> output] |

Set the output send pattern.

| Output sends | $\bullet$ on change <br> $\bullet$ <br> $\bullet$ on change and after reset <br> $\bullet$ when receiving an input object <br> $\bullet$ when receiving an input object <br> and periodically |
| :--- | :--- |
| on change of <br> (only if calculations are <br> transmitted for changes) | $1 \ldots[$ Input range depending on the type of <br> input] |
| Send cycle <br> (if sent periodically) | $5 \mathrm{~s} \ldots 2 \mathrm{~h} ; \underline{10 \mathrm{~s}}$ |

For Calculations of the form output $\mathbf{1}=\mathbf{E 1} \times \mathbf{X}+\mathbf{Y} \mid$ output $\mathbf{2}=\mathbf{E} \mathbf{2} \times \mathbf{X}+\mathbf{Y}$ define the variables $X$ and $Y$. The variables can have a positive or negative sign, 9 digits before and 9 digits after the decimal point.

| Formula for output A1: $\mathrm{A} 1=\mathrm{E} 1 \times \mathrm{X}+\mathrm{Y}$ |  |
| :--- | :--- |
| X | $\underline{1.00}$ [free input] |
| Y | $\underline{0.00}$ [free input] |
| Formula for output A2: A2 $=\mathrm{E} 2 \times \mathrm{X}+\mathrm{Y}$ |  |
| X | $\underline{1.00}$ [free input] |
| Y | $\underline{0.00}$ [free input] |

## Further settings for all formulas

If necessary, activate the input monitoring. Set which inputs are to be monitored, at which intervals the inputs are to be monitored and what value the "monitoring status" should have, if the monitoring period is exceeded without feedback.

| Use input monitoring | $\underline{\text { No }}{ }^{*}$ Yes |
| :---: | :---: |
| Monitoring of | - E1 <br> - $\overline{\mathrm{E} 2}$ <br> - E3 <br> - E1 and E2 <br> - E1 and E3 <br> - E2 and E3 <br> - E1 and E2 and E3 <br> [depending on the function] |
| Monitoring period | $5 \mathrm{~s} \bullet \ldots \cdot 2 \mathrm{~h} ; 1 \mathrm{~min}$ |
| Value of the object "monitoring status" if period is exceeded | $0 \cdot \underline{1}$ |

If necessary, activate the computer block and set what a 1 or 0 at the block entry means and what happens in the event of a block.

| Use block | No $\bullet$ Yes |
| :--- | :--- |
| Analysis of the blocking object | $\bullet$ At value 1: block \| At value 0: release |
|  | $\bullet$ At value 0: block \| At value 1: release |

| Value before first call | $\underline{0} \bullet 1$ |
| :--- | :--- |
| Output pattern <br> On block | $\bullet \underline{\text { do not send anything }}$ |
| On release | $\bullet$ send value |
|  | $\bullet$ as send pattern [see above] <br> $\bullet$ send current value immediately |

### 6.9. Logic

The device has 16 logic inputs, eight AND and eight OR logic gates.
Activate the logic inputs and assign object values up to first call.

| Use logic inputs | Yes $\bullet \underline{\text { No }}$ |
| :--- | :--- |
| Object value prior to first call for: |  |
| - Logic input 1 | $\underline{0} \bullet 1$ |
| - Logic input... | $\underline{0} \bullet 1$ |
| - Logic input 16 | $\underline{0} \bullet 1$ |

Activate the required logic outputs.

## AND logic

| AND logic 1 | $\underline{\text { not active } \bullet} \cdot$ active |
| :--- | :--- |
| AND logic... | $\underline{\text { not active }} \bullet$ active |
| AND logic 8 | $\underline{\text { not active }} \bullet$ active |

## OR logic

| OR logic 1 | $\underline{\text { not active } \bullet} \cdot$ active |
| :--- | :--- |
| OR logic $\ldots$ | $\underline{\text { not active }} \bullet$ active |
| OR logic 8 | $\underline{\text { not active }} \bullet$ active |

### 6.9.1. AND logic 1-8 and OR logic outputs $\mathbf{1 - 8}$

The same setting options are available for AND and OR logic.
Each logic output may transmit one 1 bit or two 8 bit objects. Determine what the out put should send if logic $=1$ and $=0$.

| 1. / 2. / 3. / 4. Input | $\bullet$ do not use |
| :--- | :--- |
|  | - Logic inputs $1 \ldots 16$ <br>  <br>  <br>  <br>  <br>  <br>  <br> - Logic inputs $1 \ldots 16$ inverted <br> - all switching events that the device <br> provides (see Connection inputs of the <br> AND/OR logic) |
| Output type | $\bullet$ • 1-Bit-object |
|  | $\bullet$ two 8-bit objects |

If the output type is a 1-bit object, set the output values for the various conditions.

| Output value <br> if logic $=1$ | $\underline{1} \bullet 0$ |
| :--- | :--- |
| Output value <br> if logic $=0$ | $1 \bullet \underline{0}$ |
| Output value <br> If block is active | $1 \bullet \underline{0}$ |
| Output value if <br> monitoring period is exceeded | $1 \bullet \underline{0}$ |

If the output type is two 8-bit objects, set the type of object and the output values for the various conditions.

| Object type | $\bullet$ Value $(0 \ldots 255)$ <br> $\bullet$ Percent $(0 \ldots 100 \%)$ <br> $\bullet$ Angle $\left(0 \ldots .360^{\circ}\right)$ <br> $\bullet$ Scene call-up $(0 \ldots 127)$ |
| :--- | :--- |
| Output value object A <br> if logic $=1$ | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{1}$ |
| Output value object B <br> if logic $=1$ | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{1}$ |
| Output value object A <br> if logic $=0$ | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{0}$ |
| Output value object B <br> if logic $=0$ | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{0}$ |
| Output value object A <br> if block is active | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{0}$ |
| Output value object B <br> if block is active | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{0}$ |
| Output value object A if <br> monitoring period is exceeded | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{0}$ |
| Output value object B if <br> monitoring period is exceeded | $0 \ldots 255 / 100 \% / 360^{\circ} / 127 ; \underline{0}$ |

Set the output send pattern.

| Send pattern | $\bullet$ on change of logic <br> $\bullet$ on change of logic to 1 <br> $\bullet$ on change of logic to 0 <br> • on change of logic and periodically <br> $\bullet$ on change of logic to 1 and periodically <br> $\bullet$ on change of logic to 0 and periodically <br> $\bullet$ on change of logic+object receipt <br> • on change of logic+object receipt <br> and periodically |
| :--- | :--- |
| Send cycle <br> (if sent periodically) | $5 \mathrm{~s} \bullet 10 \mathrm{~s} \bullet \ldots \bullet 2 \mathrm{~h}$ |

## Block

If necessary, activate the block for the logic output and set what a 1 or 0 at the block input means and what happens in the event of a block.

| Use block | No - Yes |
| :---: | :---: |
| Analysis of the blocking object | - At value 1: block \| At value 0: release <br> - At value 0: block \| At value 1: release |
| Blocking object value before first call | $\underline{0} 1$ |
| Output pattern On block | - Do not send message <br> - Transmit block value [see above, Output value if blocking active] |
| On release (with 2 seconds release delay) | [send value for current logic status] |

## Monitoring

If necessary, activate the input monitoring. Set which inputs are to be monitored, at which intervals the inputs are to be monitored and what value the "monitoring status" should have, if the monitoring period is exceeded without a feedback being given.

| Use input monitoring | No - Yes |
| :---: | :---: |
| Input monitoring | - 1 - $2 \cdot 3 \cdot 4$ <br> $\cdot 1+2 \cdot 1+3 \cdot 1+4 \cdot 2+3 \cdot 2+4 \cdot 3+4$ <br> $\bullet 1+2+3 \cdot 1+2+4 \bullet 1+3+4 \bullet 2+3+4$ <br> - $1+2+3+4$ |
| Monitoring period | $5 \mathrm{~s} \cdot \ldots \cdot 2 \mathrm{~h} ; 1 \mathrm{~min}$ |
| Output behaviour on exceeding the monitoring time | - Do not send message <br> - Send value exceeding [= value of the parameter "monitoring period"] |

### 6.9.3. Connection inputs of the OR logic

The OR logic connection inputs correspond to those of the AND logic. In addition, the following inputs are available for the OR logic:
Switching output AND logic 1
Switching output AND logic 1 inverted Switching output AND logic 2
Switching output AND logic 2 inverted Switching output AND logic 3
Switching output AND logic 3 inverted Switching output AND logic 4
Switching output AND logic 4 inverted
Switching output AND logic 5
Switching output AND logic 5 inverted Switching output AND logic 6
Switching output AND logic 6 inverted Switching output AND logic 7
Switching output AND logic 7 inverted Switching output AND logic 8
Switching output AND logic 8 inverted
